

Section 5.03, paragraph a, page 4, of the Scope of Work is amended as follows:

5.03 The Data Recovery Plan shall consider the following factors in connection with site 32GF130:

a. A minimum of 100 square meters of site 32GF130 will be excavated in that part of the National Register eligible portion of the site within the English Coulee Pump Station work limits (Figures 2 and 3) using formal 1 meter by 1 meter excavation units or comparable excavation methods. This represents about 2 percent of the eligible portion of the site within the work limits (5,050 square meters) and 1.5 percent of the total 6,750-square-meter (1.7 acre) eligible portion of the site. It is about 0.3 percent of the entire 34,425-square-meter (8.5 acre) site area. A combination of systematic auger probing and soil coring at tightly spaced intervals should be used early in the mitigation work to identify any high-density cultural deposits and possible features to be targeted by formal excavation units.
